Carrier Phase for Measurement Precision

High Precision GNSS Required for L3+ Autonomy

	Level 0	Level 1	Level 2	Level 3	Level 4	Level 5
Use Examples	Lane Keeping Warning	Lane Keeping Assistance	Limited Condition Assistance	Limited Condition Co-Pilot	Limited Condition Autonomy	Fully Autonomous
Driver Engagement		Control		Active	Selective	Not Required
Driver Reaction		< 1 Second		Seconds	Minutes	
Non-driving Tasks		Not Permitted		Some Allowed	Permitted	
GNSS		Standard		High Precision		
Accuracy		Street Level		Lane Level		

The need for higher accuracy

Normal GPS Accuracy - 2.5m 1σ ⁷
Error exceeds 3' lane clearance
70% of the time⁸

Autonomous driving will require
dangerous error rate of $<10^{-6}$ per hour
This necessitates 14cm 1σ accuracy⁹

Core Sensor Suite Level 3+ Autonomy

**Only sensor that
outputs absolute:**

Up Close on Baseball's Borders

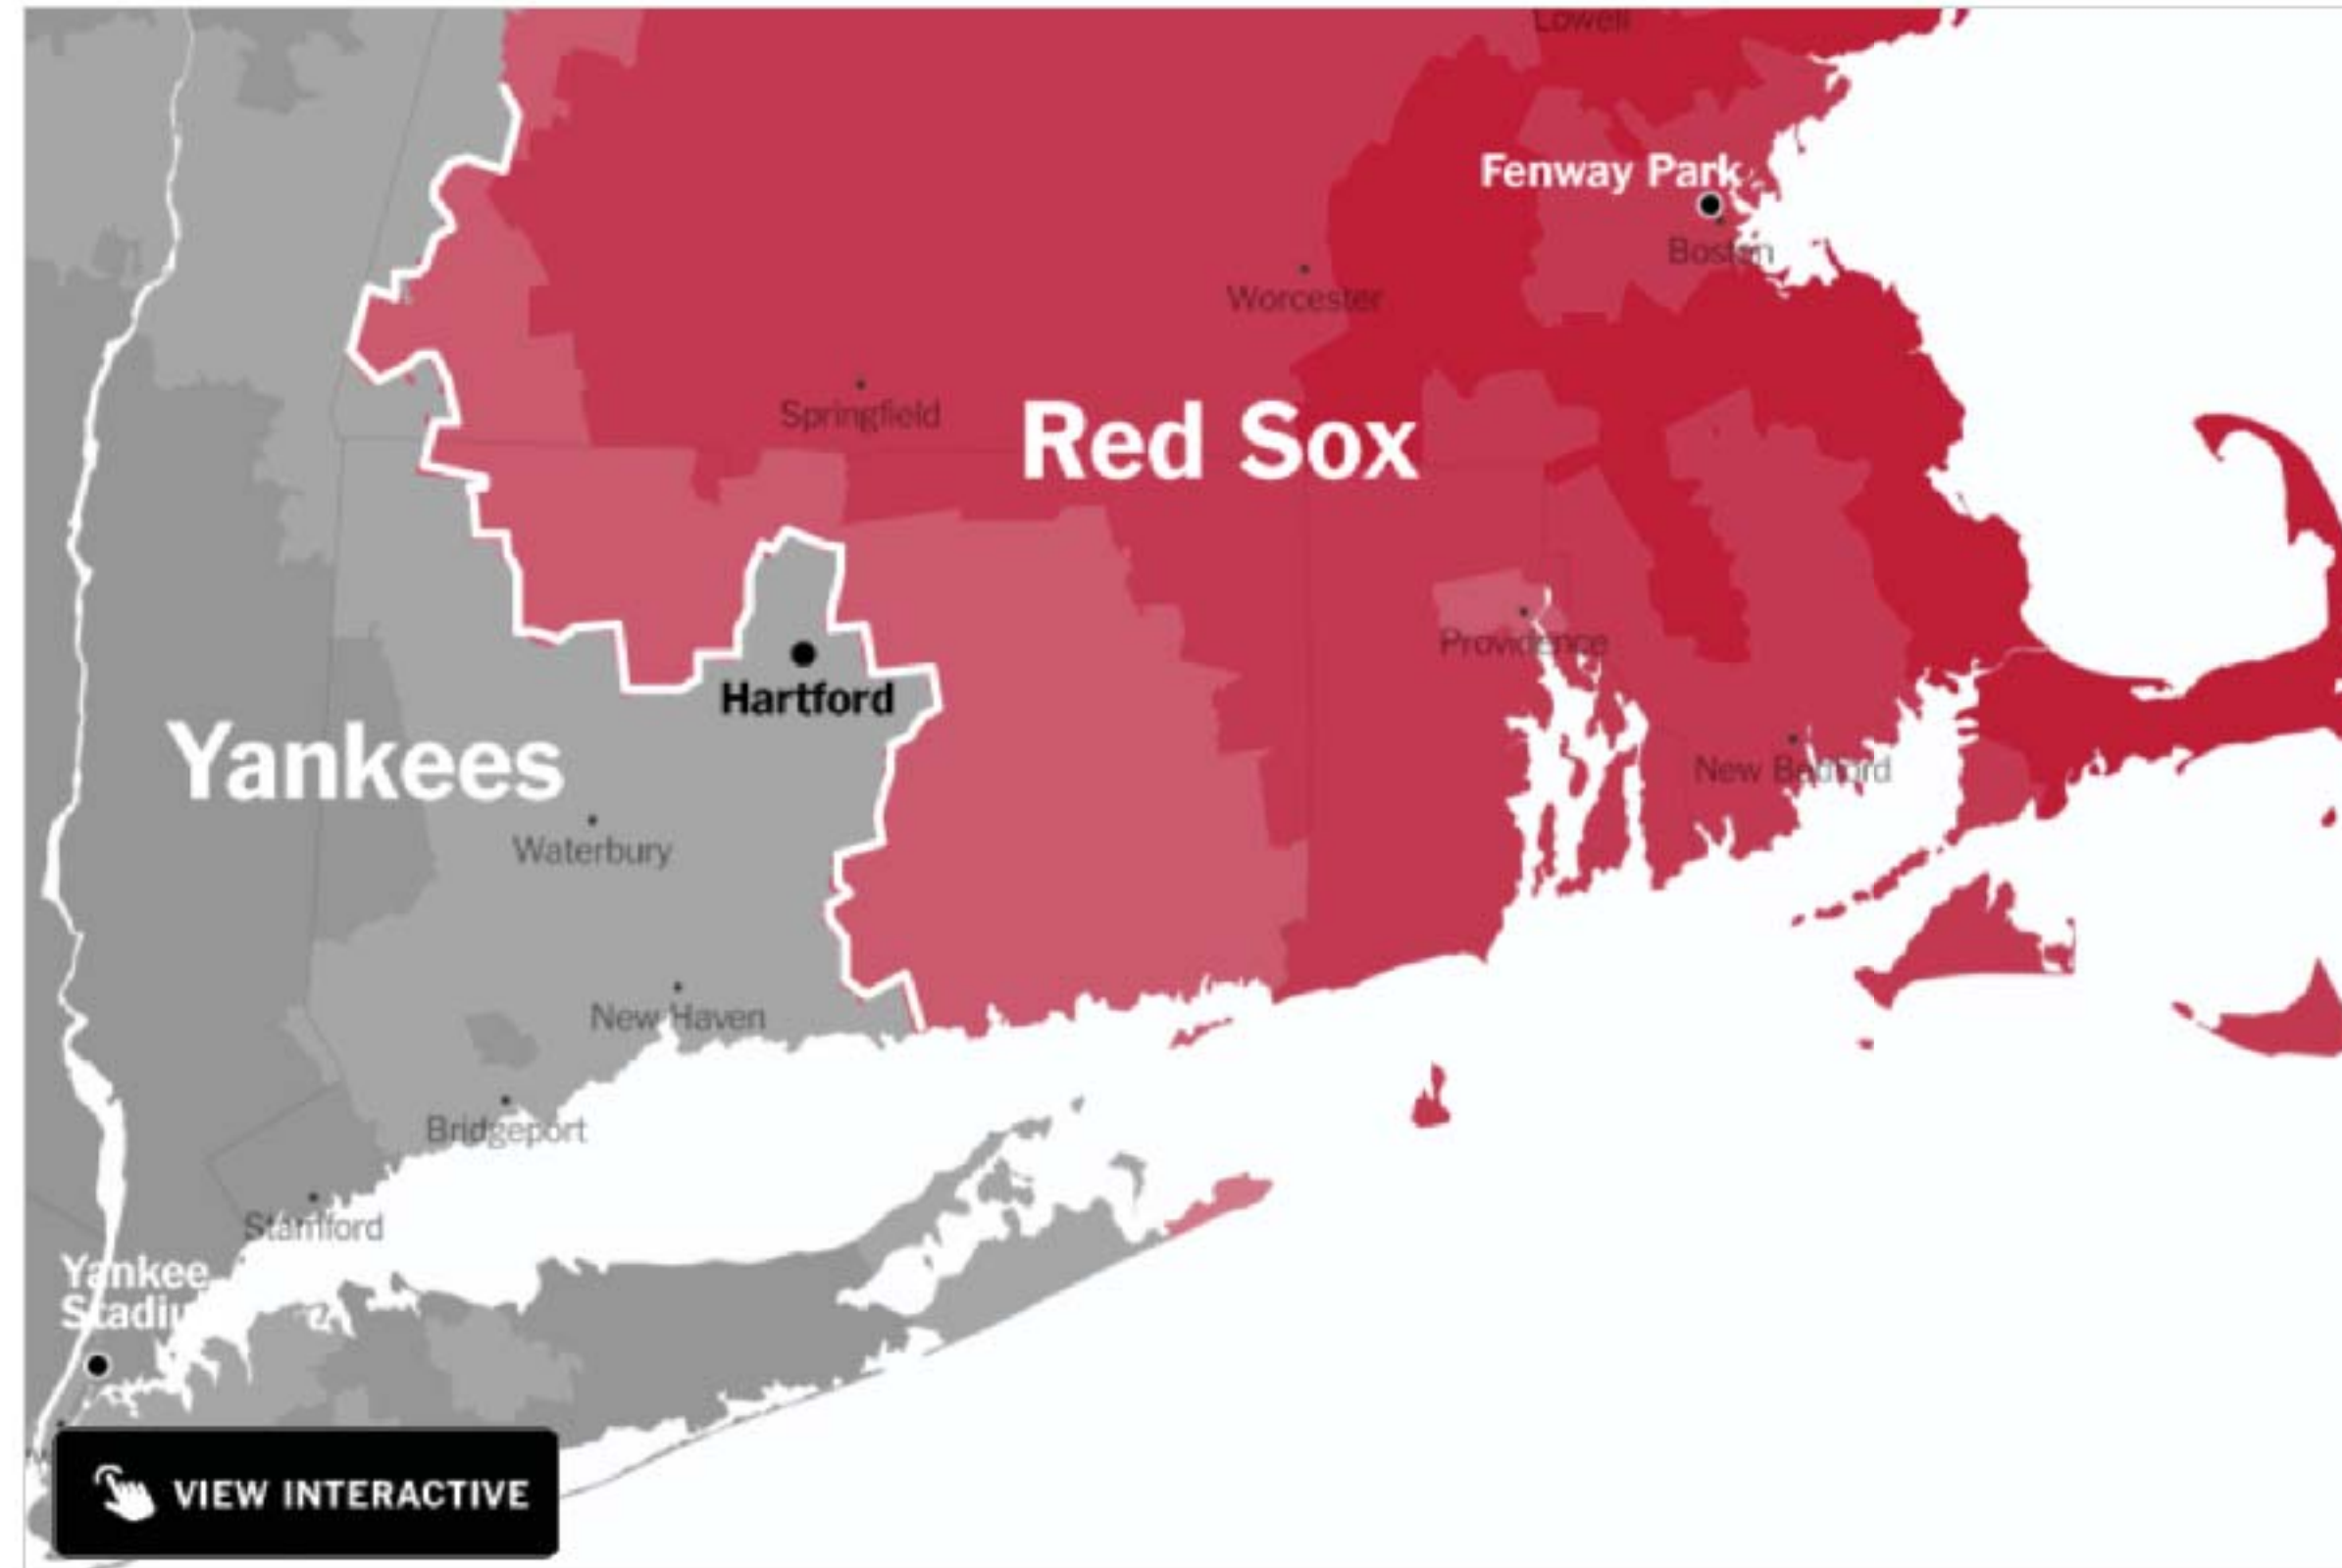

By TOM GIRATIKANON, JOSH KATZ, DAVID LEONHARDT and KEVIN QUEALY APRIL 24, 2014

Steve Rushin of Sports Illustrated [has called](#) the line running through Connecticut that separates Yankee fans and Red Sox fans the Munson-Nixon line. Mr. Rushin came up with the name — in honor of the late Yankee catcher Thurman Munson and the retired Red Sox right fielder Trot Nixon — in 2003, and he had to guess where the line ran: “north of New Haven but south of Hartford, running the breadth of central Connecticut.”

New York Yankees vs. Boston Red Sox

Munson-Nixon Redux

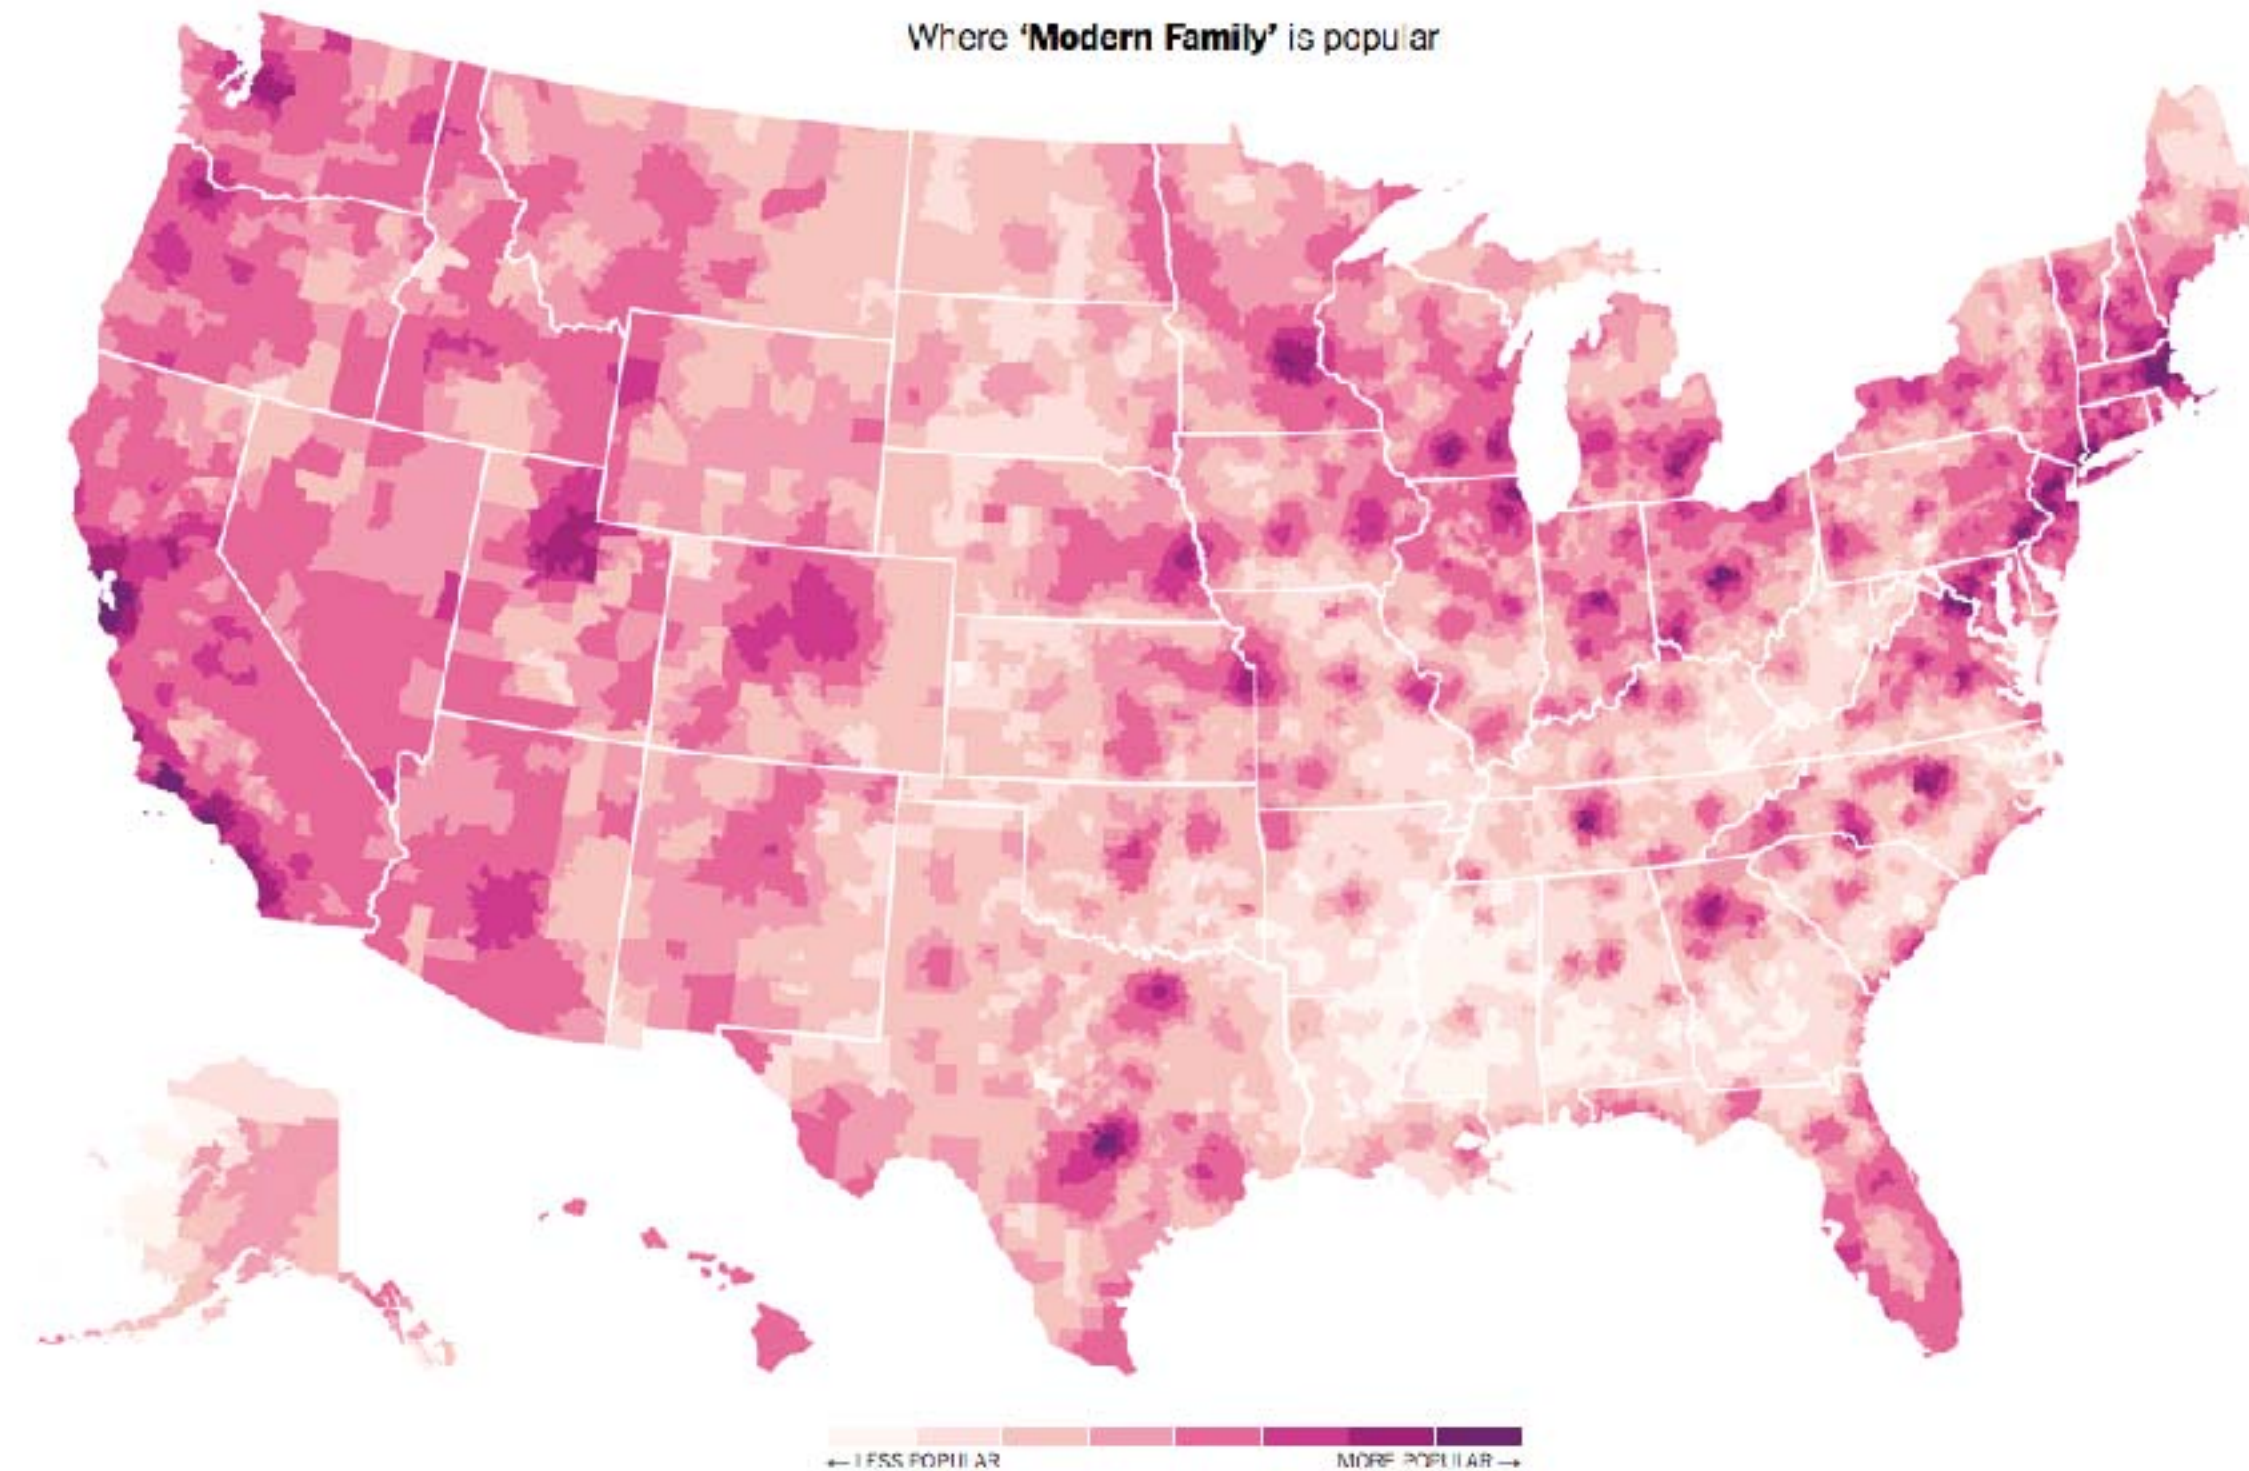

We begin with a new take on the Munson-Nixon line, which differs from some previous interpretations in that it shows that Hartford has declared for the Yankees. It's still a border town, but it's a border town the way El Paso is — clearly on the Yankee side. One tidbit: Red Sox Nation seems to have conquered some new territory since 2012, when Ben Blatt [tried to draw](#) such a line. (Winning a World Series will do that.) We also encourage you to read our colleague John Branch's [attempt at drawing](#) the line in 2006, which is quite impressive and accurate given his shoe-leather means.

Oh, Ohio

On to Columbus

Few states give their fans as many options as Ohio does. A fair-weather fan in the central part of the state could claim allegiance to several teams within a day's drive: not just the Reds and the Indians but the Cubs, the White Sox, the Pirates, the Tigers or even the Cardinals. But most Ohioans stay loyal to the home-state teams, and the border is right where you'd guess. It runs straight though Columbus, Ohio's capital and largest city, in the middle of the state. One small exception to the Reds' and Indians' dominance: The longtime presence of the Tigers' top minor league team in Toledo — the Mud Hens, the favorite team of Corporal Klinger from the television show "M*A*S*H" — has helped the Tigers claim some territory in northern Ohio.

'Duck Dynasty' vs. 'Modern Family': 50 Maps of the U.S. Cultural Divide

By JOSH KATZ DEC. 27, 2016

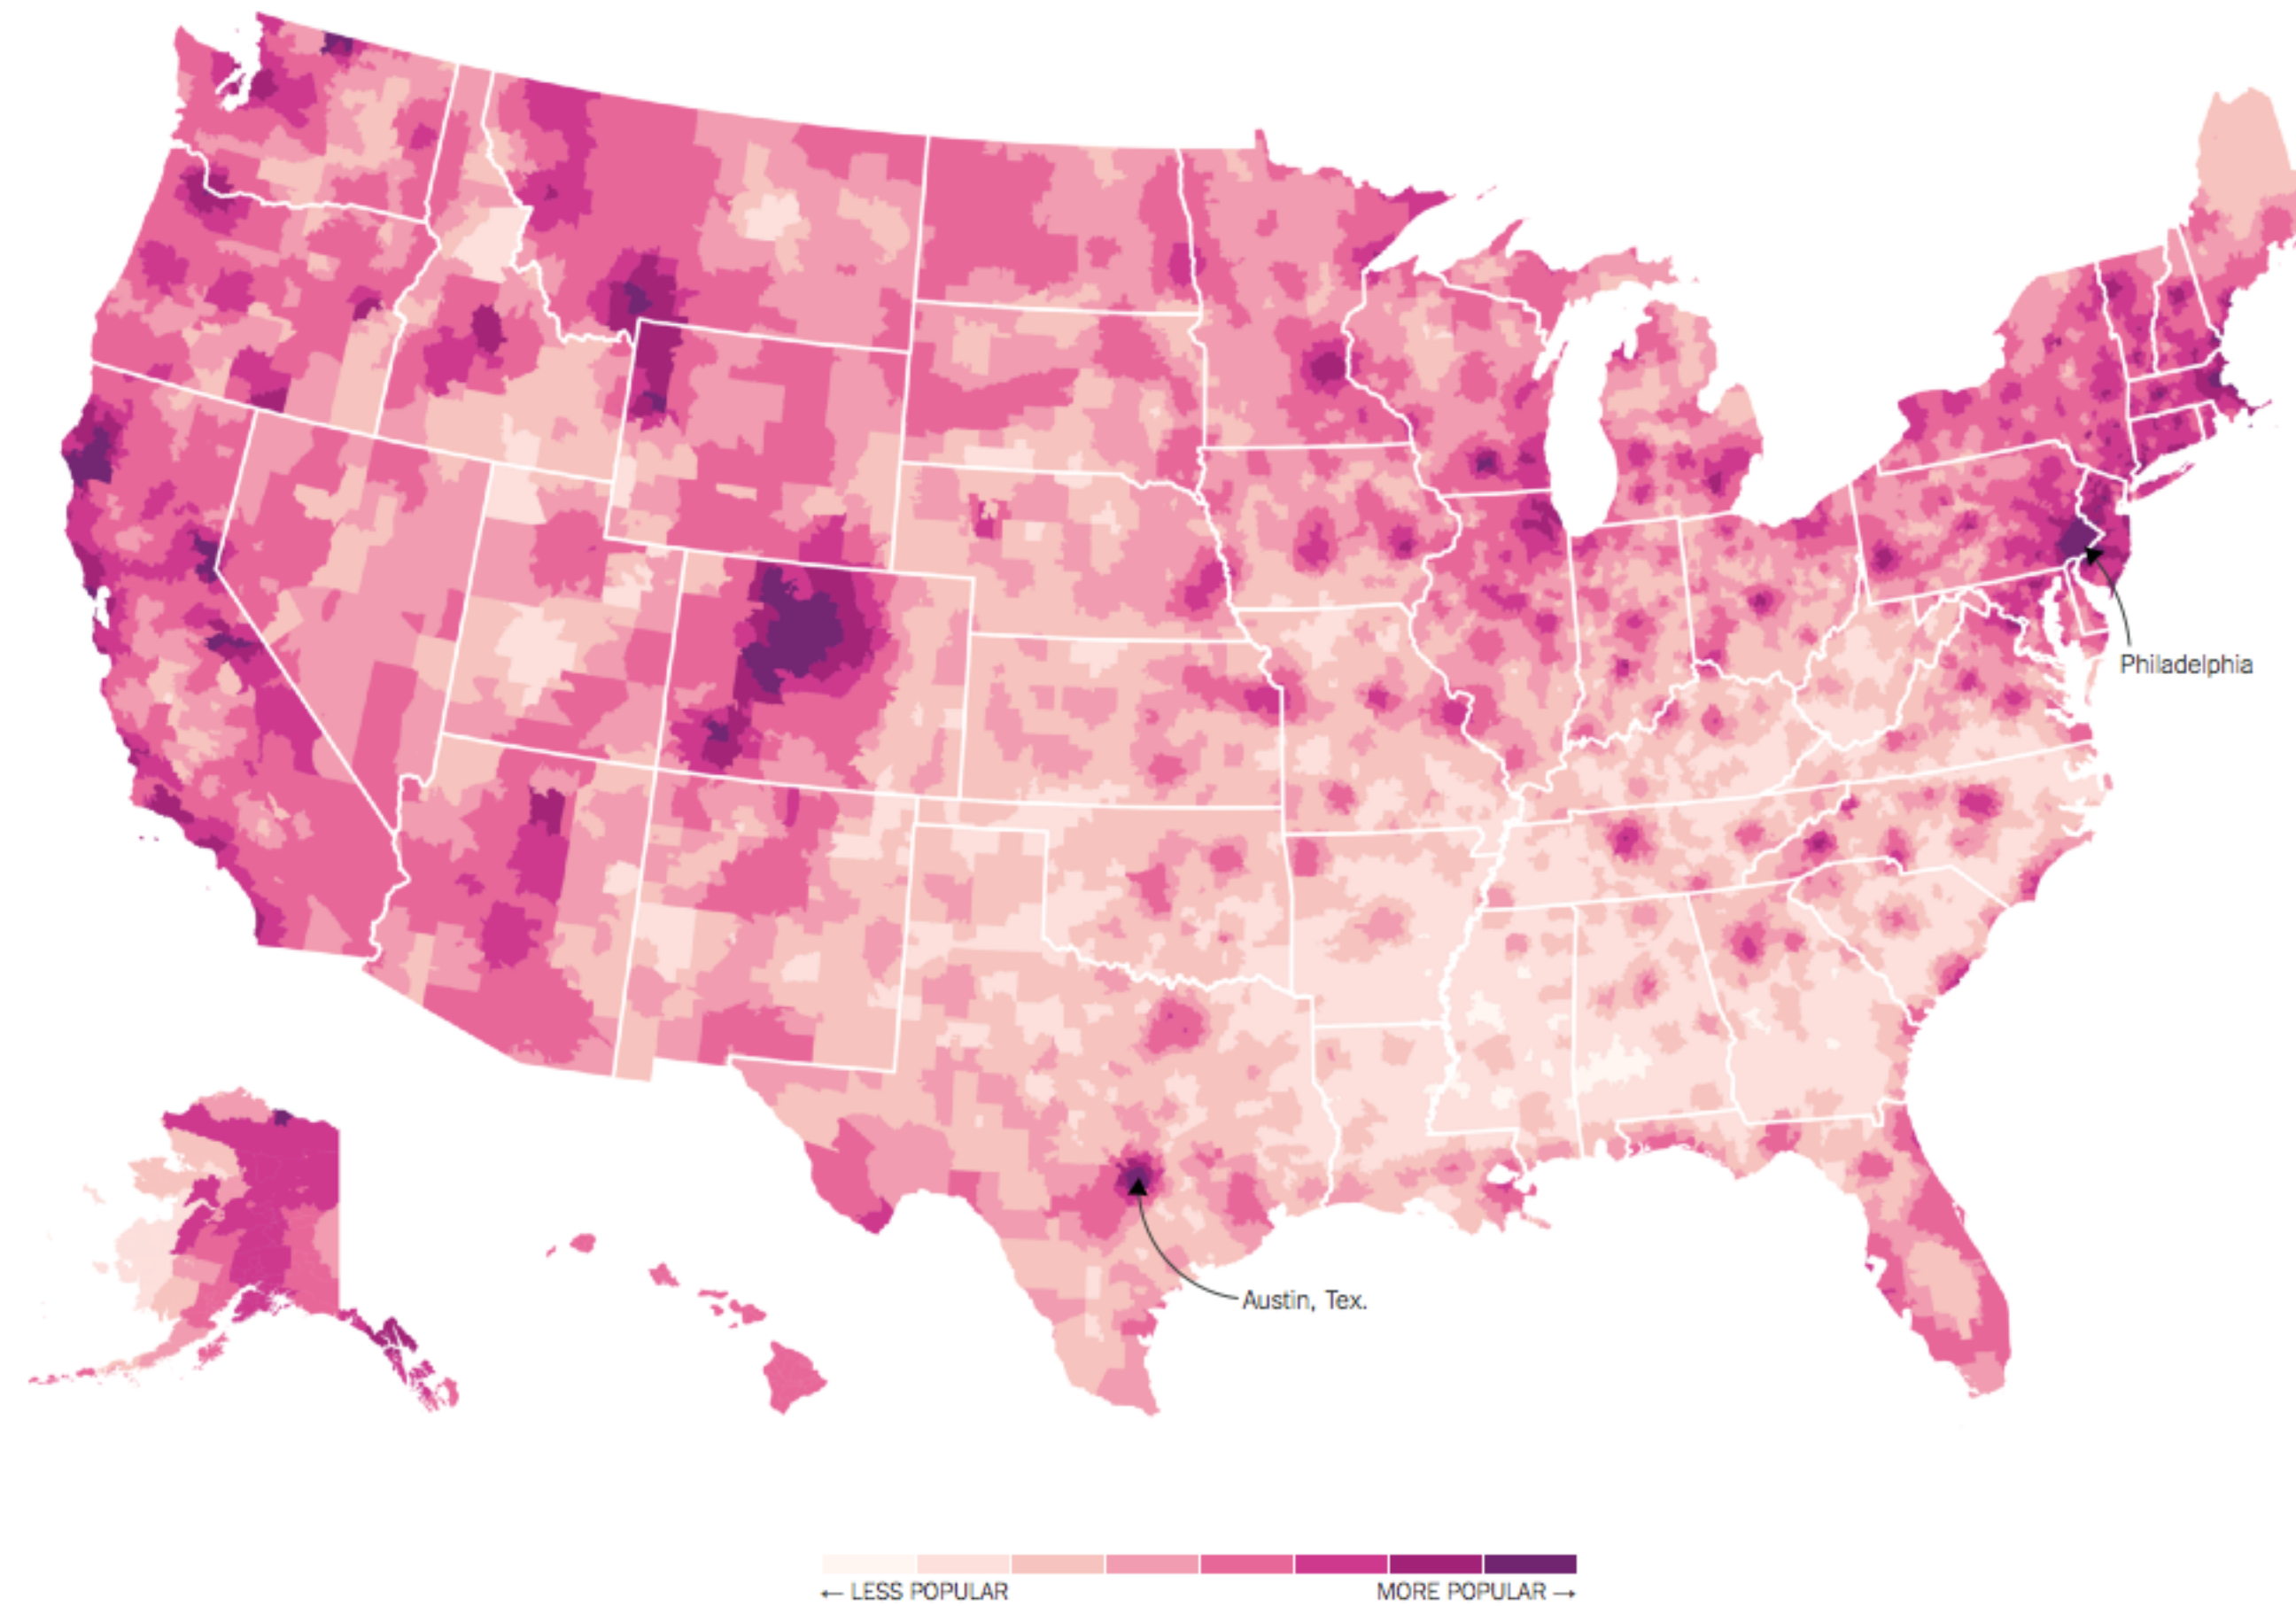

Americans have been clustering themselves into cultural bubbles just as they have clustered in political bubbles. Their TV preferences confirm that.

If you had to guess how strongly a place supported Donald J. Trump in the election, would you rather know how popular 'Duck Dynasty' is there, or how George W. Bush did there in 2000? It turns out the relationship with the TV show is stronger.

That's how closely connected politics and culture can be.

The cultural divide largely falls along urban/rural lines. We saw [a similar divide](#) in November, with Hillary Clinton winning in cities,

20. It's Always Sunny in Philadelphia

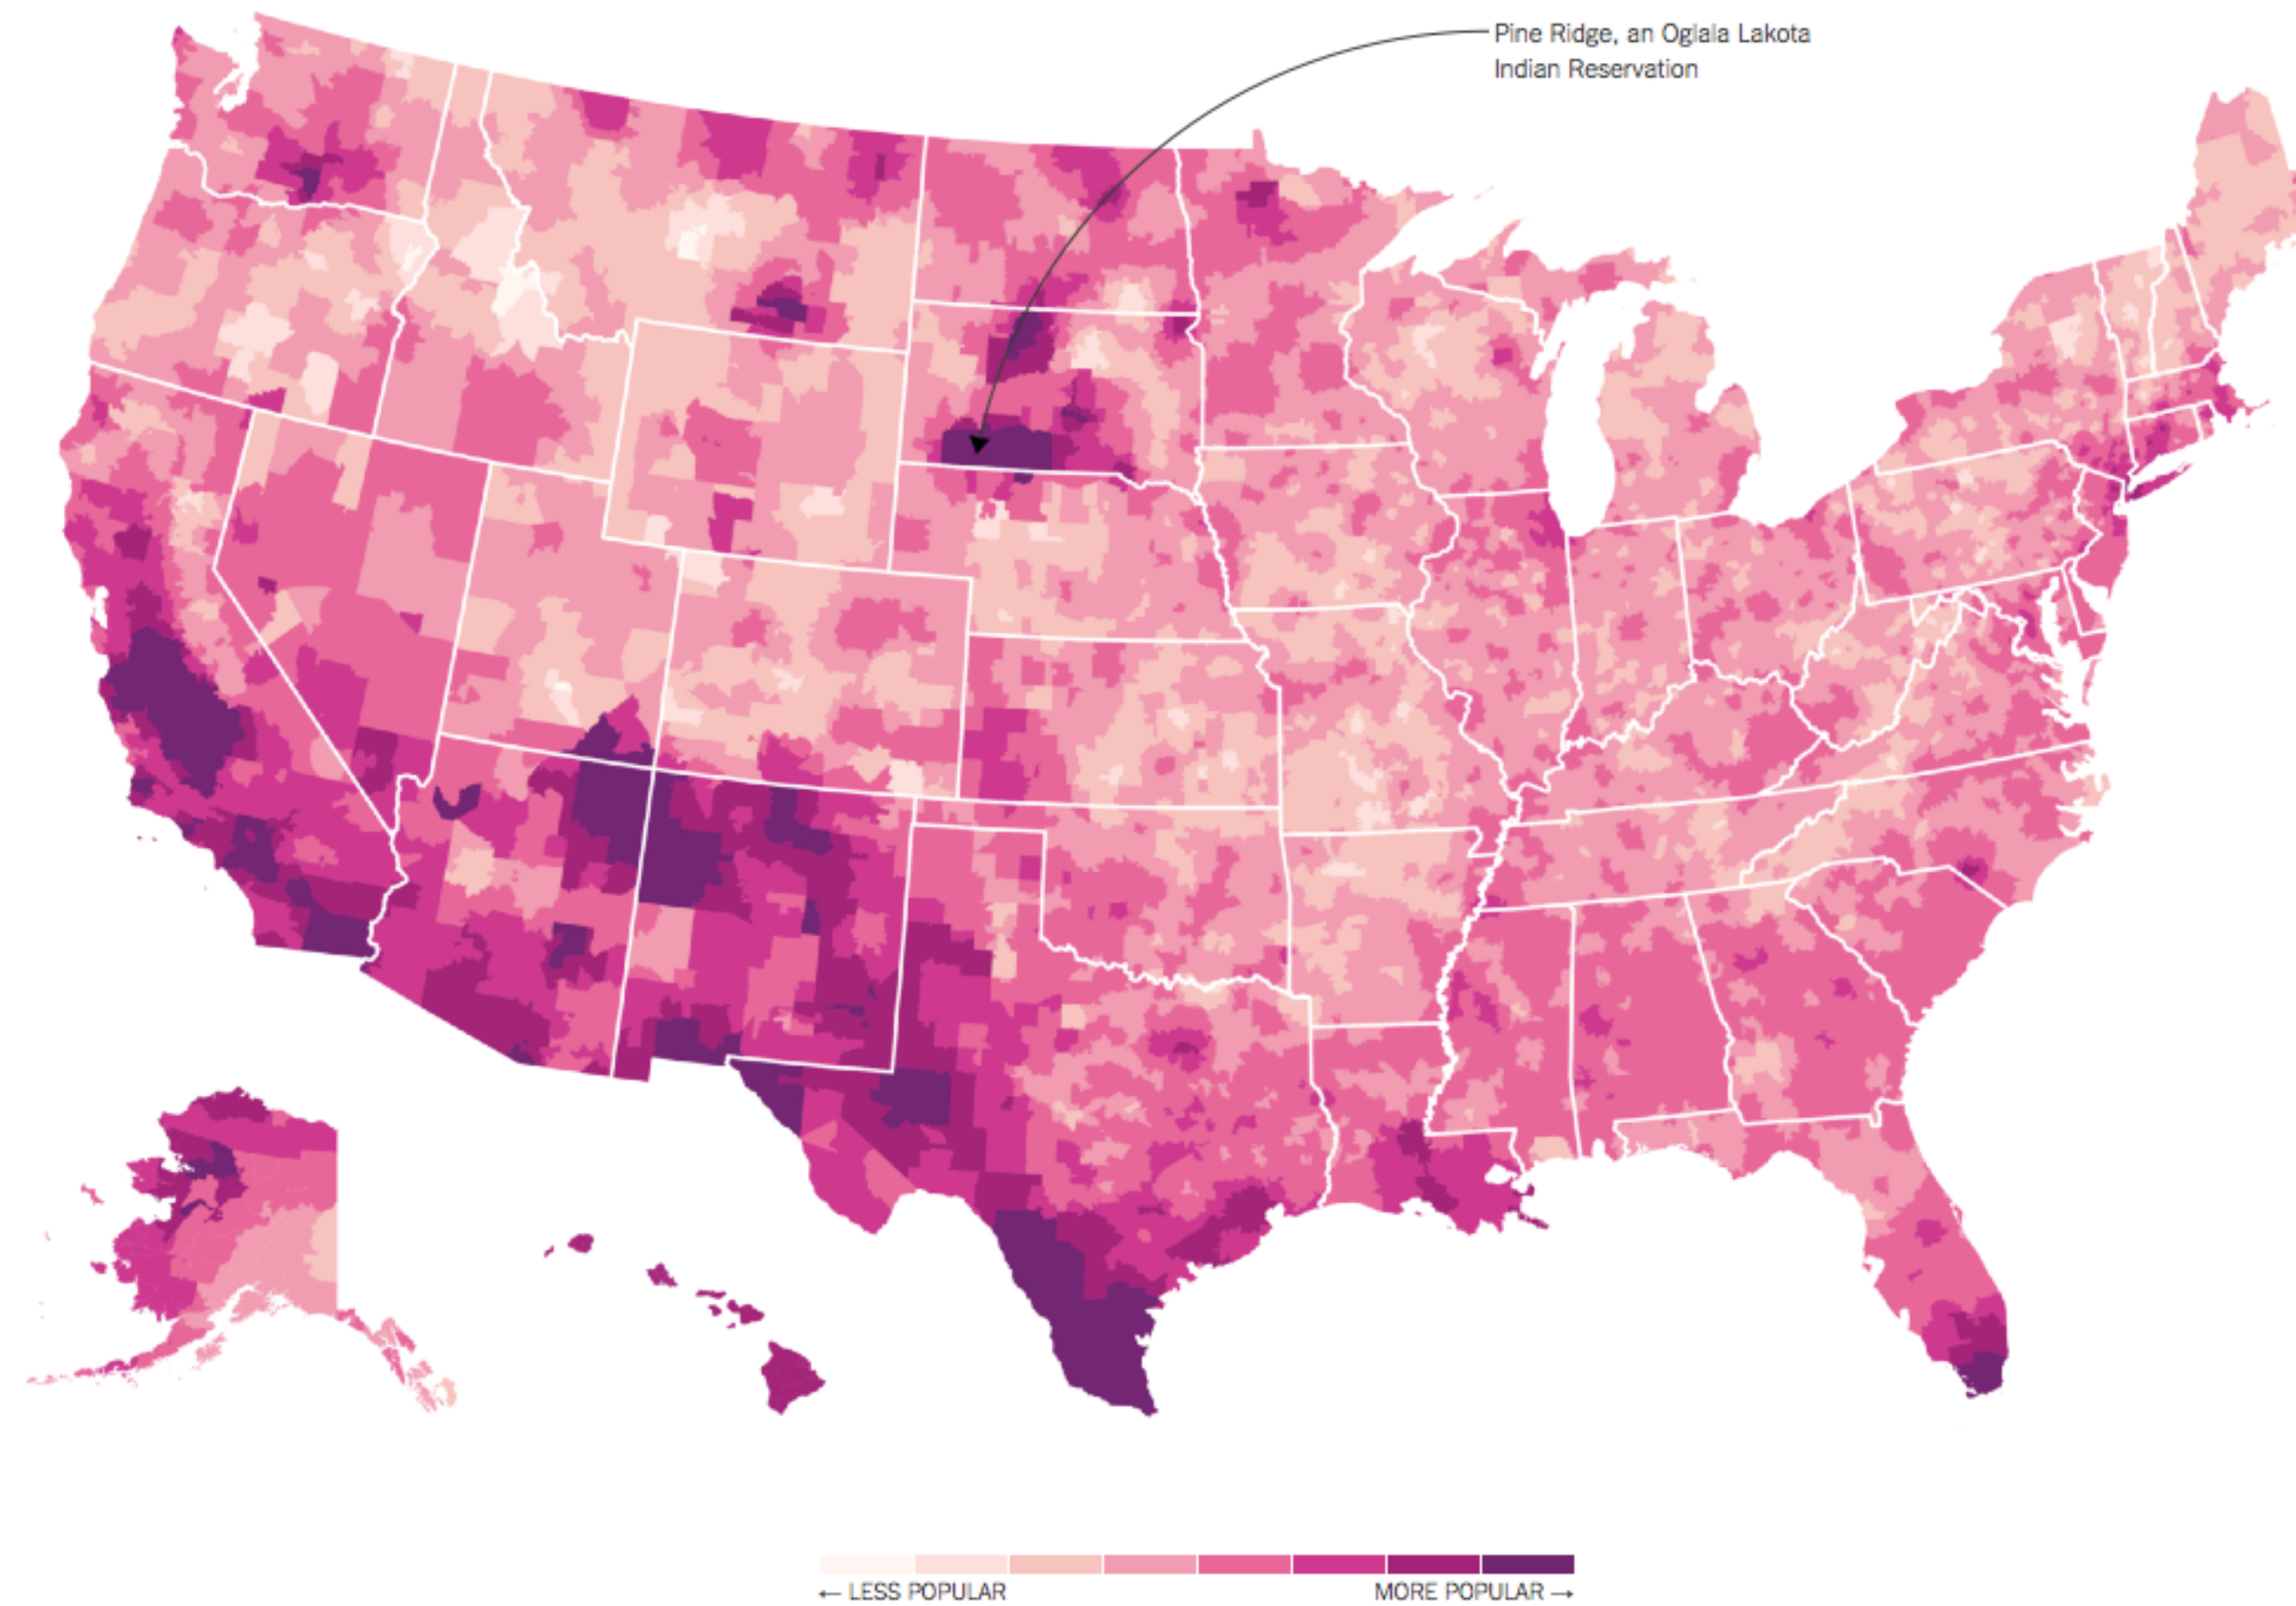

Danny DeVito is one of the gang in “It's Always Sunny in Philadelphia,” an oddball and satirical sitcom set in South Philadelphia. It's generally more popular in college towns (and most popular in Philadelphia).

The Two Americas of 2016

By TIM WALLACE NOV. 16, 2016

For many Americans, it feels as if the 2016 election split the country in two.

To visualize this, we took the election results and created two new imaginary nations by slicing the country along the sharp divide between Republican and Democratic Americas.

ABOUT US

Mapbox is a mapping platform for developers. Our building blocks make it easy to integrate location into any mobile or online application. We want to change the way people move around cities and understand our planet.

From finding a coffee spot on Foursquare, to pinning a vacation spot on Pinterest, to geo-tagging notes in Evernote – we do the geo stuff so developers can focus on building their app. Mapbox is the foundation for other platforms, letting enterprises analyze their data, drone companies publish flyovers, real estate sites visualize properties, satellite companies process cloud-free imagery, and insurance companies track assets.

Mapbox is an open source company. We build our product with open source parts, work in the open, and release as much code as possible – it's the right thing for people, technology, and business.

MAPBOX TELEMETRY

Mapbox SDKs collect anonymous data about the map and device location to continuously update and improve your maps.

Mapbox Streets data

The best underlying street and place data is updated every minute across our entire platform.

A smarter city: partnering with Melbourne to solve complex urban challenges

By  Christina Franken on January 13 2017 NEWS

[cities](#) [open data](#) [transportation](#) [telemetry](#)

Melbourne is changing the way cities are run. Australia's fastest growing city's [Smart City Office](#) has a clear vision: *to enhance the aspects of our city that make us uniquely Melbourne, and intelligently prepare for the changing needs of the community, the environment, and the economy.* That's exactly the kind of innovative thinking we launched [Mapbox Cities](#) to help support, and we're very excited to announce Melbourne as our first featured partner.

Melbourne as a smart city

Our vision for Melbourne as a smart city is simple: to enhance the aspects of our city that make us uniquely Melbourne, and intelligently prepare for the changing needs of the community, the environment and the economy.

We're not in the business of rolling out technology's latest bells and whistles for the sake of it. Instead, we're working with the community (residents, workers, businesses, students and visitors) to design, develop and test the best ways for you to live, work and play in Melbourne. In many cases, innovations in technology will have a role to play in creating and enhancing these experiences.

As a smart city, we're already off and running. We're prototyping tailor-made initiatives such as our work with people who are blind, deaf or deaf-blind to better understand how they navigate through the city. As a result of this research, we've partnered with Vision Australia to trial beacon technology in Campbell Arcade, which transmits location-specific information to phones. And our Open Data platform has almost 100 unique data sets that are available for anyone to access and use, such as our 24-hour pedestrian counting system, which helps us understand
